Self-Service Release Build

Releases your teams run themselves. The second half of the fee is due when they do.

One pipeline per release flow, built in the tools you already run.

What changes

- Hand-run steps and handoffs become one pipeline per release flow, started by the team.
- "Where is it now?" gets answered by status messages in chat or the ticket.
- Every stage checks its own result, and rollback is tested before go-live.
- The one person who knows how becomes a runbook, a trained team, and a pipeline your team has already changed on its own.
- The approvals your policy requires run inside the pipeline, and every production release leaves a change record your change board can check.

Included in every Build

- Status messages in chat or the ticket for every release
- A change record for every production release: approval, author, commit and deploy
- A tested rollback, a runbook and 30 days of support
- Signed artifacts, a software bill of materials for every release, and an audit export

Add-on

Release from Slack or Teams: start, approve and roll back from chat

No lock-in

Everything is built in your repositories and accounts, in tools you already run. No ES.nl software and no licence. You own what is built as it is committed to your repositories. Your team maintains it with the runbook and the training, or hands the upkeep to Release Care.
